

SCHAEFFLER

Has this ever happened to you? Stacked Tolerance Complications

Prevent Comebacks, Choose Quality

Brakes are the most important category to a shop, and comebacks on brake jobs can frequently cause the loss of a customer.

Worn, damaged, or inferior bearings frequently lead to the misdiagnosis of brake problems, including “warped rotors,” when in fact the culprit is increased lateral runout in the bearing/hub assembly. When combined with the runout in the rotor, these stacked tolerances can cause the pad to improperly contact the rotor, leading to a thickness variation and pedal pulsation.

Inferior quality bearings don't have as tight of a tolerance and are more prone to problems. That is why it is important to choose a safer, more reliable, high-quality bearing.

Lifetime Loyalty with One Install

Safeguard against potential setbacks - don't waste up to half of your lateral tolerance on inferior bearings. Schaeffler's high-quality bearings ensure optimal functionality and longevity when it's needed most.

Schaeffler is one of the largest OE bearing suppliers in the world, producing over 30 million wheel bearings each year for new vehicle manufacturers. Schaeffler sets the standard for quality, durability and performance with our OE quality wheel bearings, which are researched, designed and constructed through precision manufacturing. Compared to value-grade/aftermarket hub units, OE quality hub units have significantly less lateral runout and a service life of up to four times longer. Lateral runout and other bearing related issues are minimized significantly when premium quality units are installed, which reduces the likelihood of comebacks.
